## Abstract and figures

A slow evaporation method has grown the sodium 4-nitrophenolate dehydrate (S4NPD) crystals. FTIR and Raman spectra have analyzed the chemical structure of synthesized S4NPD. The single crystal XRD and Powder XRD studies confirmed S4NPD crystal contains the orthorhombic crystal system. The UV-Vis absorption and transmittance analysis reveal that the grown crystal possesses an optical transmittance in the visible and NIR regions. The cut-off wavelength of the S4NPD is 435 nm, and these features are more appropriate for emerging optical fields. The photoluminescence spectrum shows the peak absorbed at 517 nm, indicating green light emission. The nonlinear optical properties with the enhancing role of the growth crystal's second and third-harmonic generation efficiencies. The laser threshold damage (LDT) value shows the suitability of crystal coupled with high-power laser output applications. A chemical etching study was carried out to examine the growth pattern of the S4NPD crystal.

## ABSTRACT

A slow evaporation method has grown the sodium 4-nitrophenolate dehydrate (S4NPD) crystals. FTIR and Raman spectra have analyzed the chemical structure of synthesized S4NPD. The single crystal XRD and Powder XRD studies confirmed S4NPD crystal contains the orthorhombic crystal system. The UV–Vis absorption and transmittance analysis reveal that the grown crystal possesses an optical transmittance in the visible and NIR regions. The cut-off wavelength of the S4NPD is 435 nm, and these features are more appropriate for emerging optical fields. The photoluminescence spectrum shows the peak absorbed at 517 nm, indicating green light emission. The nonlinear optical properties with the enhancing role of the growth crystal's second and third-harmonic generation efficiencies. The laser threshold damage (LDT) value shows the suitability of crystal coupled with high-power laser output applications. A chemical etching study was carried out to examine the growth pattern of the S4NPD crystal.

## 1 Introduction

Many researchers in recent years have focused on different types of single crystals for the suitability of multifunctional device fabrication for nonlinear

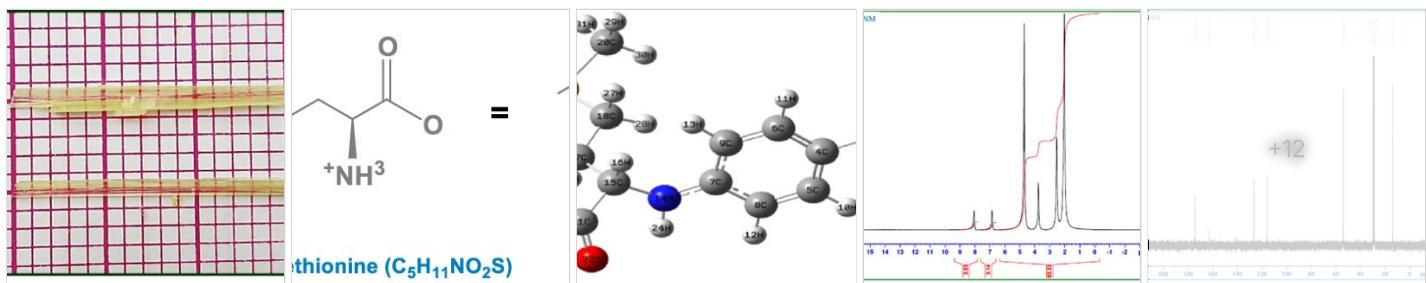

optical applications. Due to affordability, organic crystals are widely used in various industrial applications [1, 2]. Since organic molecules have the unique nature of a delocalized electron mechanism which enhances NLO properties, compounds can be

The good quality of the nonlinear optical (4-nitrophenyl) methionine—4NM single organic crystal has been successfully grown using the slow evaporation technique. The lattice parameter, molecular structure and various functional groups of the 4NM grown crystal were confirmed by single-crystal XRD, nuclear magnetic resonance, and Fourier transform infrared spectral analysis, respectively. UV-Vis have identified the...

A semiorganic lithium para-nitrophenolate dihydrate ( $\text{LiPNP} \cdot 2\text{H}_2\text{O}$ ) nonlinear optical crystal with a dimension of  $18 \times 11 \times 4\text{mm}^3$  and a refractive index of  $n_{20^\circ\text{C}} = 1.65$ . The crystal exhibits second-harmonic generation (SHG) efficiency equivalent to that of  $\text{LiNbO}_3$ . The optical absorption edge is observed at approximately 350 nm, and the visible light transmittance is high, ranging from 80% to 90% across the visible spectrum.

Phosphoric acid influenced the crystal structure of hexamine p-nitrophenol and their physico-chemical properties. Supermolecular assembly of hexamine, p-nitrophenol, phosphoric acid and water (HNPP) crystal was grown through slow evaporation process in acetone–water solvent. The HNPP crystal exhibits both second harmonic generation (SHG) and third order nonlinear consequences. Single crystal XRD reveals that...

Journal of Molecular Structure

Karuppasamy P · Kamalesh Tamilselvan · Anitha Kandasamy · [...] · Sunil Verma

New efficient nonlinear optical (NLO) organic single crystals of quinoline 4-nitrophenol (QNP) were grown by slow evaporation solution technique (SEST) at room temperature using methanol as solvent. Primarily, the three dimensional (3D) intensity data of grown QNP crystal were collected by the single crystal X-ray diffraction (SXRD). The crystal structure was solved by the direct method using SHELXS and refined usin...
